

Authorship:

The JIMS defines authorship in accordance with the criteria recommended by [the International Committee of Medical Journal Editors \(ICMJE\)](#), which include:

- Substantial contributions to the conception or design of the work; or the acquisition, analysis, or interpretation of data for the work; AND
- Drafting the work or revising it critically for important intellectual content; AND
- Final approval of the version to be published; AND
- Agreement to be accountable for all aspects of the work in ensuring that questions related to the accuracy or integrity of any part of the work are appropriately investigated and resolved.

All those identified as authors should meet all four criteria, and all those who meet this criteria should be identified as authors. It is the authors' responsibility to decide on the listed authors and their order.

As a guideline, supervisors are generally identified as the senior (last) author of a manuscript, with the primary author being listed first.

The JIMS accepts co- authorships in the event multiple authors contributed equally to the work.

Authors should be able to identify which co-authors are responsible for specific parts of the work. Those who do not meet all four criteria should be **acknowledged** with specified contributions.

The student author is the designated **corresponding author** and must be able to take public responsibility for the content. As corresponding author, s/he has the following responsibilities, as listed on the [ICMJE](#):

- Primary contact with the journal during the submission and review process as well as after publication for critiques and additional information if required.
- Completion of the administrative requirements by providing, *inter alia*
 - Details of authorship
 - Ethics committee approval (refer to 'Research Involving Animals and Humans' section below)
 - Clinical trial registration documentation (if indicated)
 - Conflicts of interest forms and statements

If authorship is **disputed**, this should be resolved at the institution(s) where the work has been performed according to the ICMJE recommendations. If **changes** to authorship are requested for appropriate reasons, agreement from all authors is required in writing following [the COPE flowchart](#).

Copyright

Authors who publish with this journal agree to the following terms:

- The authors assert that they know of no reason why any portion of the article submitted may not be published.
- It is the authors' responsibility to ensure that any text, picture, graph, diagram or other aspect of the article submitted does not infringe upon the ownership or copyright of another party.
- The authors agree to be responsible and accountable for all aspects of the work in ensuring that questions related to the accuracy or integrity of any part of the work are appropriately investigated and resolved. The author releases JIMS, the IMA and their employees and officials from any liability in this regard.
- In submitting work to the JIMS, writers agree to free access and use of the material published in it with proper acknowledgement of authorship.
- After an article has been accepted it may be edited for length or to conform to house style (punctuation, end note formatting etc) and the JIMS reserves the right to make the final decisions regarding editorial changes.
- Publication in each issue will be limited and will occur at the Editor's discretion. If articles are unable to be published in the upcoming issue, authors can choose to have their accepted articles transferred for publication on the website, or to be considered for publication in a subsequent issue.

Privacy Policy

Please be advised that JIMS may collect and store information from website users and journal readers, including, but not necessarily limited to, author information such as name, title, and institute; contact information such as name, email address and phone number; any information you provide through online communication (through website or email) and details about which articles you have accessed and when.

JIMS may use this information for several purposes, such as, website quality or social media enhancement; assessment of performance and popularity of published articles and facilitating contact with users who have initiated communication with JIMS.

This information may be collected through various sources, including, *inter alia*, website forms including contact forms, Re-search system, manuscript submission forms, submission itself or any other data provided to JIMS platforms; communication directly with JIMS through email, social media or any other mean and website cookies collected by any device.

JIMS is dedicated to protecting your personal information. JIMS will not share any personal information with third parties unless required by law. While we cannot ensure or guarantee that loss, misuse or alteration of information will never occur, we use all reasonable efforts to prevent it.

You should bear in mind that transmission over the internet is never entirely secure and therefore we cannot guarantee absolute security of your information.

If you have reason to believe your interaction with us is no longer secure, notify us immediately.

Informed consent

From "Ethical Considerations in the Conduct and Reporting of Research: Privacy and Confidentiality" by the International Committee of Medical Journal Editors:

Patients have a right to privacy that should not be violated without informed consent. Identifying information, including names, initials, or hospital numbers, should not be published in written descriptions, photographs, or pedigrees unless the information is essential for scientific purposes and the patient (or parent or guardian) gives written informed consent for publication. Informed consent for this purpose requires that an identifiable patient be shown the manuscript to be published. Authors should disclose to these patients whether any potential identifiable material might be available via the Internet as well as in print after publication.

Nonessential identifying details should be omitted. Informed consent should be obtained if there is any doubt that anonymity can be maintained. For example, masking the eye region in photographs of patients is inadequate protection of anonymity. If identifying characteristics are altered to protect anonymity, such as in genetic pedigrees, authors should provide assurance, and editors should so note, that such alterations do not distort scientific meaning.

When informed consent has been obtained, it should be indicated in the published article.

Conflict of Interest

From "Ethical Considerations in the Conduct and Reporting of Research: Conflicts of Interest" by the International Committee of Medical Journal Editors:

When authors submit a manuscript, whether an article or a letter, they are responsible for disclosing all financial and personal relationships that might bias their work. To prevent ambiguity, authors must state explicitly whether potential conflicts do or do not exist. Authors should do so in the manuscript on a conflict-of-interest notification page that follows the title page, providing additional detail, if necessary, in a cover letter that accompanies the manuscript.

Authors should identify Individuals who provide writing or other assistance and disclose the funding source for this assistance.

Investigators must disclose potential conflicts to study participants and should state in the manuscript whether they have done so.

Editorial and Reviewers' Conflict of Interest

At the time of the invitation, reviewers are asked to disclose any conflicts of interest that could affect their review.

Editors and reviewers should not be involved in making decisions about or reviewing manuscripts in which they may have a conflict of interest. This includes, but not limited to, if an editor or a reviewer has:

- worked in the same institution (e.g. worked in the same research institute at a similar time, not attended the same university)
- current/recent collaboration with an author, including recent publications and/or grants
- a personal relationship with the author

Editorial Decisions

JIMS editors will ensure all relevant conflicts of interest are declared in publication.

JIMS editors will ensure unbiased reviews by not seeking reviewers with conflicts of interests.

Plagiarism

Prior to the publication, all articles are run through the plagiarism check via the plagiarism detection software ([iThenticate](#)).

If plagiarism is suspected, JIMS will take action in accordance with the [COPE flowchart](#).

Human and Animal Testing

Studies involving animals and/or humans should include a statement on **ethics approval** by an ethics committee or institutional review board.

Studies involving humans should include a statement regarding **consent to participate** in research. Case reports should be de-identified. When submitting to the JIMS, authors acknowledge consent has been obtained for the case to be published via the submission form, and authors should retain a signed consent form.

From "Ethical Considerations in the Conduct and Reporting of Research: Protection of Human Subjects and Animals in Research" by the International Committee of Medical Journal Editors:

When reporting experiments on human subjects, authors should indicate whether the procedures followed were in accordance with the ethical standards of the responsible committee on human experimentation (institutional and national) and with the Helsinki Declaration of 1975, as revised in 2000. If doubt exists whether the research was conducted in accordance with the Helsinki Declaration, the authors must explain the rationale for their approach and demonstrate that the institutional review body explicitly approved the doubtful aspects of the study. When reporting experiments on animals, authors should indicate whether the institutional and national guide for the care and use of laboratory animals was followed.
